Mean Hadamard Inequalities & Elasticity

Elliott Sullinge-Farrall

University of Surrey

March 13, 2024

Table of Contents

We start with the classical (or pointwise) Hadamard's inequality

$$|M|^n \ge C_n |\det M| \qquad \forall M \in \mathbb{R}^{n \times n}$$

where $C_n = n^{\frac{n}{2}}$ is the optimal constant.

We start with the classical (or pointwise) Hadamard's inequality

$$|M|^n \ge C_n |\det M| \qquad \forall M \in \mathbb{R}^{n \times n}$$

where $C_n = n^{\frac{n}{2}}$ is the optimal constant.

We then define a mean Hadamard inequality to be of the form

$$\mathbb{E}_{\mathsf{p}}(\varphi) := \int_{\Omega} |\nabla \varphi|^2 + \mathsf{p}(x) \det \nabla \varphi \, \mathrm{d} x \ge 0 \qquad \forall \varphi \in \mathcal{V} \subset H^1_0(\Omega; \mathbb{R}^n)$$

・ロト ・ 目 ・ ・ ヨト ・ ヨ ・ うへつ

We seek $p: \Omega \to \mathbb{R}$ such that this inequality holds.

We start with the classical (or pointwise) Hadamard's inequality

$$|M|^n \ge C_n |\det M| \qquad \forall M \in \mathbb{R}^{n \times n}$$

where $C_n = n^{\frac{n}{2}}$ is the optimal constant.

We then define a mean Hadamard inequality to be of the form

$$\mathbb{E}_{\mathsf{p}}(\varphi) := \int_{\Omega} |\nabla \varphi|^2 + \mathsf{p}(x) \det \nabla \varphi \, \mathrm{d} x \ge 0 \qquad \forall \varphi \in \mathcal{V} \subset H^1_0(\Omega; \mathbb{R}^n)$$

We seek $p: \Omega \to \mathbb{R}$ such that this inequality holds.

We call \mathbb{E}_p the excess functional with pressure function p.

We start with the classical (or pointwise) Hadamard's inequality

$$|M|^n \geq C_n |\det M| \qquad \forall M \in \mathbb{R}^{n \times n}$$

where $C_n = n^{\frac{n}{2}}$ is the optimal constant.

We then define a mean Hadamard inequality to be of the form

$$\mathbb{E}_{\mathsf{p}}(\varphi) := \int_{\Omega} |\nabla \varphi|^2 + \mathsf{p}(x) \det \nabla \varphi \, \mathrm{d} x \ge 0 \qquad \forall \varphi \in \mathcal{V} \subset H^1_0(\Omega; \mathbb{R}^n)$$

We seek $p: \Omega \to \mathbb{R}$ such that this inequality holds.

We call \mathbb{E}_p the excess functional with pressure function p. From now on, we will consider only the case of n = 2 dimensions. In general, we find that the "size" of p is not important,

In particular, the excess is translation invariant w.r.t pressure:

$$\mathbb{E}_{\mathbf{p}+\mathbf{p}_0} = \mathbb{E}_{\mathbf{p}} \qquad \forall \mathbf{p}_0 \in \mathbb{R}$$

In particular, the excess is translation invariant w.r.t pressure:

$$\mathbb{E}_{p+p_0} = \mathbb{E}_p \qquad \forall p_0 \in \mathbb{R}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

This can be used to obtain our first result:

Sufficient Condition (Bounded Pressure)

 $\left| f \left| p - p_\Omega \right|_\infty \leq 2 \text{, then } \mathbb{E}_p \geq 0.$

In particular, the excess is translation invariant w.r.t pressure:

$$\mathbb{E}_{p+p_0} = \mathbb{E}_p \qquad \forall p_0 \in \mathbb{R}$$

This can be used to obtain our first result:

Sufficient Condition (Bounded Pressure)

If $|p - p_{\Omega}|_{\infty} \leq 2$, then $\mathbb{E}_{p} \geq 0$.

We finally note that, since \mathbb{E}_p is degree 2 homogeneous, non-negativity is equvalent to existence of a global minimiser.

We now switch perspective to that of elasticity. Consider deformations $u \in H^1_{u_0}(\Omega; \mathbb{R}^2)$ of some flat material Ω .

We now switch perspective to that of elasticity. Consider deformations $u \in H^1_{u_0}(\Omega; \mathbb{R}^2)$ of some flat material Ω .

The elastic energy of such a deformation is given by the Dirichlet energy functional

$$\mathbb{D}(u) = \int_{\Omega} |\nabla u|^2 \, \mathrm{d}x$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

We now switch perspective to that of elasticity. Consider deformations $u \in H^1_{u_0}(\Omega; \mathbb{R}^2)$ of some flat material Ω .

The elastic energy of such a deformation is given by the Dirichlet energy functional

$$\mathbb{D}(u) = \int_{\Omega} |\nabla u|^2 \, \mathrm{d}x$$

Principle of least action tells us that the observed deformation will minimise this energy:

$$\Delta u = 0$$
$$u|_{\partial\Omega} = u_0$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

We now switch perspective to that of elasticity. Consider deformations $u \in H^1_{u_0}(\Omega; \mathbb{R}^2)$ of some flat material Ω .

The elastic energy of such a deformation is given by the Dirichlet energy functional

$$\mathbb{D}(u) = \int_{\Omega} |\nabla u|^2 \, \mathrm{d}x$$

Principle of least action tells us that the observed deformation will minimise this energy:

$$\Delta u = 0$$
$$u|_{\partial\Omega} = u_0$$

However, in general, these minimisers will not be mass conserving:

$$\det
abla u
eq 1$$

Mass Conservation

We now introduce the space of mass conserving admissibles:

$$\mathcal{A} = \{ u \in H^1_{u_0}(\Omega; \mathbb{R}^2) : \det
abla u = \det
abla u_0 = 1 \}$$

Mass Conservation

We now introduce the space of mass conserving admissibles:

$$\mathcal{A} = \{ u \in H^1_{u_0}(\Omega; \mathbb{R}^2) : \det
abla u = \det
abla u_0 = 1 \}$$

We consider additive variations of u_0 in this (non-linear) space, so we require \mathcal{V} such that

$$\varphi \in \mathcal{V} \quad \Rightarrow \quad u_0 + \varphi \in \mathcal{A}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Mass Conservation

We now introduce the space of mass conserving admissibles:

$$\mathcal{A} = \{ u \in H^1_{u_0}(\Omega; \mathbb{R}^2) : \mathsf{det}\,
abla u = \mathsf{det}\,
abla u_0 = 1 \}$$

We consider additive variations of u_0 in this (non-linear) space, so we require \mathcal{V} such that

$$\varphi \in \mathcal{V} \quad \Rightarrow \quad u_0 + \varphi \in \mathcal{A}$$

We find that

$$\mathcal{V} = \{ \varphi \in H^1_0(\Omega; \mathbb{R}^2) : \det \nabla \varphi = - \operatorname{cof} \nabla u_0 \cdot \nabla \varphi \}$$

Derivation of the Excess

We then find that

$$\mathbb{D}(u_0 + \varphi) = \mathbb{D}(u_0) + \mathbb{E}_{p}(\varphi) \qquad \forall \varphi \in \mathcal{V}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

where p solves $\Delta u_0 + \frac{1}{2} \operatorname{cof}(\nabla u_0) \nabla p = 0$.

Derivation of the Excess

We then find that

$$\mathbb{D}(u_0 + \varphi) = \mathbb{D}(u_0) + \mathbb{E}_p(\varphi) \qquad \forall \varphi \in \mathcal{V}$$

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

where p solves $\Delta u_0 + \frac{1}{2} \operatorname{cof}(\nabla u_0) \nabla p = 0$.

Hence $\mathbb{E}_p \ge 0$ is equivalent to the minimisation of the elastic energy (w.r.t to these variations).

The ease of minimising the Dirichlet energy is largely due to the fact that it is **convex**.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The ease of minimising the Dirichlet energy is largely due to the fact that it is **convex**.

The excess, however, is only polyconvex.

Polyconvexity (2D)

A function $f : \mathbb{R}^{2 \times 2} \to \mathbb{R}$ is polyconvex if there exists convex $g : \mathbb{R}^{2 \times 2} \times \mathbb{R} \to \mathbb{R}$ such that

 $f(M) = g(M, \det M)$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

The ease of minimising the Dirichlet energy is largely due to the fact that it is **convex**.

The excess, however, is only polyconvex.

Polyconvexity (2D)

A function $f : \mathbb{R}^{2 \times 2} \to \mathbb{R}$ is polyconvex if there exists convex $g : \mathbb{R}^{2 \times 2} \times \mathbb{R} \to \mathbb{R}$ such that

 $f(M) = g(M, \det M)$

There are existing DM type results for polyconvex functionals but \mathbb{E}_p does not meet the growth conditions for them to be applied.

The ease of minimising the Dirichlet energy is largely due to the fact that it is **convex**.

The excess, however, is only polyconvex.

Polyconvexity (2D)

A function $f : \mathbb{R}^{2 \times 2} \to \mathbb{R}$ is polyconvex if there exists convex $g : \mathbb{R}^{2 \times 2} \times \mathbb{R} \to \mathbb{R}$ such that

 $f(M) = g(M, \det M)$

There are existing DM type results for polyconvex functionals but \mathbb{E}_p does not meet the growth conditions for them to be applied.

This motivates the search for novel techniques to analyse these functionals.

Table of Contents

Piecewise Constant Pressure

J.Bevan, M.Kružík and J.Valdman have considered piecewise constant p.

Piecewise Constant Pressure

J.Bevan, M.Kružík and J.Valdman have considered piecewise constant p.

If we consider two state pressure on a square domain $\Omega = [-1,+1]^2$

 $\mathsf{p} = c\chi_\Omega$ $\Omega' \subset \Omega$ with suff. boundary regularity

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

then $\mathbb{E}_p \geq 0$ iff $|c| \leq 2C_2 = 4$.

J.Bevan, M.Kružík and J.Valdman have considered piecewise constant p.

If we consider two state pressure on a square domain $\Omega = [-1,+1]^2$

 $\mathsf{p} = c\chi_\Omega$ $\Omega' \subset \Omega$ with suff. boundary regularity

then $\mathbb{E}_p \geq 0$ iff $|c| \leq 2C_2 = 4$.

They also considered three state pressure with either 'insulation' or 'point-contact'.

|--|

Above we have an example of a 'window' layout pressure function.

On the right is an example of a 'grid' layout pressure function.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

For the 'window' layout, there exists a $\gamma_0 > 0$ (depending only on the domain) such that

$$c \leq 2\sqrt{1+\gamma_0} \quad \Rightarrow \quad \mathbb{E}_\mathsf{p} \geq 0$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

For the 'window' layout, there exists a $\gamma_0 > 0$ (depending only on the domain) such that

$$c \leq 2\sqrt{1+\gamma_0} \quad \Rightarrow \quad \mathbb{E}_{\mathsf{p}} \geq 0$$

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

It can also be shown that $\mathbb{E}_p\geq 0$ can not be achieved for arbitrarily small insulation width.

For the 'window' layout, there exists a $\gamma_0 > 0$ (depending only on the domain) such that

$$c \leq 2\sqrt{1+\gamma_0} \quad \Rightarrow \quad \mathbb{E}_{\mathsf{p}} \geq 0$$

It can also be shown that $\mathbb{E}_p \ge 0$ can not be achieved for arbitrarily small insulation width.

For the 'grid' layout, we have

$$|c| \leq \sqrt{8} pprox 2.83 \quad \Longleftrightarrow \quad \mathbb{E}_{\mathsf{p}} \geq 0$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

For the 'grid' layout, we have

$$|c| \leq \sqrt{8} pprox 2.83 \quad \Longleftrightarrow \quad \mathbb{E}_{\mathsf{p}} \geq 0$$

There are also partial results for finer grids.

Radially Linear Pressure

Perhaps the next most simple case to consider is $\Omega = B$ and

$$\mathsf{p}(r) = cr \qquad r = |x|$$

Radially Linear Pressure

Perhaps the next most simple case to consider is $\Omega = B$ and

$$p(r) = cr$$
 $r = |x|$

For reference purposes, we calculate

$$\mathsf{p}_B = rac{2}{3}c \quad \Rightarrow \quad |\mathsf{p} - \mathsf{p}_B|_\infty = rac{2}{3}c$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

so $|c| \leq 3$ is sufficient for $\mathbb{E}_{p} \geq 0$.

Radially Linear Pressure

Perhaps the next most simple case to consider is $\Omega = B$ and

$$p(r) = cr$$
 $r = |x|$

For reference purposes, we calculate

$$p_B = \frac{2}{3}c \quad \Rightarrow \quad |p - p_B|_{\infty} = \frac{2}{3}c$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

so $|c| \leq 3$ is sufficient for $\mathbb{E}_{p} \geq 0$.

Can we obtain a mean Hadamard inequality with |c| > 3?

Fourier Splitting

We shall start by writing φ as a Fourtier series:

$$\varphi = \sum_{j \ge 0} \varphi^{(j)} = \frac{1}{2} A_0(r) + \sum_{j > 0} A_j(r) \cos(j\theta) + B_j(r) \sin(j\theta)$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Fourier Splitting

We shall start by writing φ as a Fourtier series:

$$\varphi = \sum_{j \ge 0} \varphi^{(j)} = \frac{1}{2} A_0(r) + \sum_{j > 0} A_j(r) \cos(j\theta) + B_j(r) \sin(j\theta)$$

We then observe that the excess splits over the modes in the following way:

$$\mathbb{E}_{\mathsf{p}}(\varphi) = \sum_{j \ge 0} \int_{B} \left| \varphi_{,r}^{(j)} \right|^{2} + \left| \varphi_{,\tau}^{(j)} \right|^{2} + \frac{\mathsf{c}}{2} \varphi_{,\tau}^{(j)} \times \varphi^{(j)} \, \mathrm{d}x$$

We note that, if we replaced $\varphi_{,r}^{(j)}$ with $\varphi^{(j)}$, we would have something that resembles a quadratic form in the integrand.

Weighted Poincaré Inequality

We now make use of the following result, a corollary of a weighted Poincaré inequality:

Poincaré Inequality for Modes

Denote by j_0 the first zero of the Bessel J function. Then

$$\int_{B} \left| \varphi^{(j)} \right|^{2} \, \mathrm{d}x \leq \frac{1}{j_{0}^{2}} \int_{B} \left| \varphi^{(j)}_{,r} \right|^{2} \, \mathrm{d}x \qquad \forall j \geq 1$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

where the inequality is sharp.

Weighted Poincaré Inequality

We now make use of the following result, a corollary of a weighted Poincaré inequality:

Poincaré Inequality for Modes

Denote by j_0 the first zero of the Bessel J function. Then

$$\int_{B} \left| \varphi^{(j)} \right|^{2} \, \mathrm{d}x \leq \frac{1}{j_{0}^{2}} \int_{B} \left| \varphi^{(j)}_{,r} \right|^{2} \, \mathrm{d}x \qquad \forall j \geq 1$$

where the inequality is sharp.

This allows us to write

$$\mathbb{E}_{\mathsf{p}}(\varphi) \geq \sum_{j \geq 0} \int_{B} v^{(j)} \cdot M(c) v^{(j)} \, \mathrm{d}x \qquad v^{(j)} = \left(\begin{vmatrix} \varphi^{(j)} \\ \varphi^{(j)}_{,\tau} \end{vmatrix} \right)$$

Sufficient Condition for Non-Negativity

The matrix for the quadratic form is

$$M(c) = \begin{pmatrix} j_0^2 & -\frac{c}{4} \\ -\frac{c}{4} & 1 \end{pmatrix}$$

Sufficient Condition for Non-Negativity

The matrix for the quadratic form is

$$M(c)=egin{pmatrix} j_0^2&-rac{c}{4}\-rac{c}{4}&1 \end{pmatrix}$$

We compute

tr
$$M = 1 + j_0^2$$
 det $M = j_0^2 - \left(\frac{c}{4}\right)^2$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Sufficient Condition for Non-Negativity

The matrix for the quadratic form is

$$M(c)=egin{pmatrix} j_0^2&-rac{c}{4}\-rac{c}{4}&1 \end{pmatrix}$$

We compute

tr
$$M = 1 + j_0^2$$
 det $M = j_0^2 - \left(\frac{c}{4}\right)^2$

Hence, we have

$$c \leq 4j_0 \quad \Rightarrow \quad \mathbb{E}_{p}(\varphi) \geq 0$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

For reference, $rac{2}{3} imes 4j_0 pprox 6.41$

In general, obtaining tight necessary conditions is difficult.

In general, obtaining tight necessary conditions is difficult. However, reasonable bounds can be obtained via numerical calculations.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

In general, obtaining tight necessary conditions is difficult. However, reasonable bounds can be obtained via numerical calculations.

We will seek out a φ such that, as we increase c, the excess eventually becomes negative.

In general, obtaining tight necessary conditions is difficult. However, reasonable bounds can be obtained via numerical calculations.

We will seek out a φ such that, as we increase c, the excess eventually becomes negative.

The 'better' our choice of φ , the tighter our bounds will be.

Inspired by the sharpness of the pointwise Hadamard inequality, we consider φ satisfying the PDI:

 $abla arphi \in \mathsf{O}(2)$ $arphi|_{\partial B} = \mathsf{0}$

It is known that there is a dense solution space in $W^{1,\infty}$ and that every solution is piecewise affine.

For convenience, we construct a solution on the domain $[-2, +2]^2$ and then scale several copies of the solution to make them fit in the unit ball without overlaps.

For convenience, we construct a solution on the domain $[-2, +2]^2$ and then scale several copies of the solution to make them fit in the unit ball without overlaps.

In the gaps between these rescaled squares, we just take $\varphi = 0$.

For convenience, we construct a solution on the domain $[-2, +2]^2$ and then scale several copies of the solution to make them fit in the unit ball without overlaps.

In the gaps between these rescaled squares, we just take $\varphi = 0$. This gives a solution to the PDI on *B*.

For convenience, we construct a solution on the domain $[-2, +2]^2$ and then scale several copies of the solution to make them fit in the unit ball without overlaps.

In the gaps between these rescaled squares, we just take $\varphi = 0$. This gives a solution to the PDI on *B*.

We then compute the excess in terms of c and calculate the value of c for which this becomes negative.

For convenience, we construct a solution on the domain $[-2, +2]^2$ and then scale several copies of the solution to make them fit in the unit ball without overlaps.

In the gaps between these rescaled squares, we just take $\varphi = 0$. This gives a solution to the PDI on *B*.

We then compute the excess in terms of c and calculate the value of c for which this becomes negative.

We will obtain different thresholds for different arrangements of the squares.
